

# CHRISTENSEN'S PLANT CENTER

## Wholesale Supplier To Landscape Professionals

### Sowing grass seed

A good time to seed a lawn is in the spring after the last frost. In Michigan, cool weather grasses such as Kentucky Bluegrass, Fescue, and Rye will give a lawn it's best chance. Do not plant in extreme heat or cold, as these abnormal temps will make it difficult for the seeds to germinate. Check the weather and sow your seeds the day of or before rain, being careful of hard rains, which cause seeds to run off your lawn. Dirt needs to remain moist for up to two weeks during germination, so water, water, and more water.

Christensen's offers a variety of grass seed and patch including 25-pound seed bags that cover 1000 sq. ft. We also carry seed accelerators and fertilizers to ensure germination and growth giving lawns the nutrients it needs. Any questions, come on in and talk to a professional - we're here to help.
